

Best Western High Speed Internet Access

Your connection to the Internet during your stay in our Hotel is available via the broadband network connector in your room or wireless in the courtyard or by the pool.

The wireless network is open 80211.b standard and doesn't require any special settings. It also is not secure so be sure to protect your computer by turning your firewall ON.

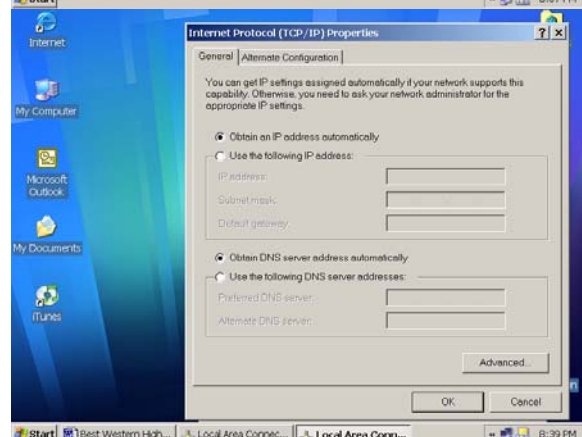

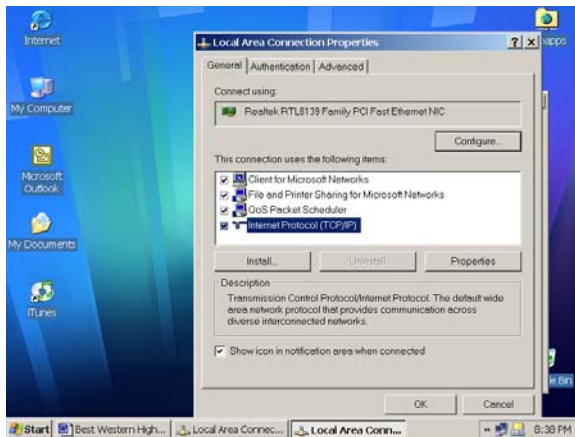

If your computer has a network adapter just plug in the network cable in the broadband connector and boot up. Start browsing and enjoy it! It's free.

Your computer will acquire an IP (network address) automatically. In case the setup of your computer prevents this to happen, change the setup of your network adapter to obtain an IP automatically. If it sounds complicated here is how you can do it:

Right click on the network adapter Icon and select "status"

In the next screen select "properties"

Highlight "Internet Protocol (TCP/IP) and click "properties"

Select the two automatic IP and DNS option; click OK and in a couple of seconds your computer will be connected to the Internet.

In the unlikely situation that it still doesn't work our customer support service will assist you. Call **1-877-268-4074** and a technician will help you sort out the problem.

You can also access the Internet using the computer provided by the Hotel to the guests at no charge.
